Prof. Xiongfei Wang
Editor-in-Chief
IEEE Transactions on Power Electronics

Dear Prof. Wang,

We are pleased to submit our original manuscript entitled “Mitigation of High-Frequency Common-Mode Voltage in 2-Level 3-Phase Voltage Source Inverters” for your consideration in *IEEE Transactions on Power Electronics*. This work presents a significant advancement in common-mode voltage (CMV) mitigation that has neither been published previously nor is currently under review elsewhere.

The study addresses the persistent challenge of CMV in industrial motor drives by introducing an innovative modification to conventional sinusoidal pulse width modulation (SPWM). Our approach achieves CMV reduction while maintaining full compatibility with traditional motor control schemes. The method requires only minimal additional computational resources, enabling deployment on standard platforms such as commercial microcontrollers or FPGAs without hardware modifications. By effectively eliminating the generated common-mode dv/dt , this solution directly extends motor insulation and bearing lifetimes, which is a critical concern for industrial applications. Experimental validation with modern wide-bandgap devices confirms the practical feasibility of this approach.

The manuscript adheres to IEEE format requirements and has been approved by all authors. We appreciate your consideration and look forward to the reviewers’ feedback.

Sincerely yours,

Enes Ayaz
(on behalf of all authors)
